 - Industrial: -40°C to 85°C
 - Automotive-A: -40°C to 85°C
 - Automotive-E: -40°C to 125°C
- High Speed: 55 ns
- Voltage Range: 4.5V to 5.5V Operation
- Low Active Power
 - 275 mW (max)
- Low Standby Power (LL version)
 - 82.5 μ W (max)
- Easy Memory Expansion with $\overline{\text{CE}}$ and $\overline{\text{OE}}$ Features
- TTL-Compatible Inputs and Outputs
- Automatic Power Down when Deselected
- CMOS for Optimum Speed and Power
- Available in Pb-free and Non Pb-free 28-Pin (600-mil) PDIP, 28-Pin (300-mil) Narrow SOIC, 28-Pin TSOP-I, and 28-Pin Reverse TSOP-I Packages

Functional Description

The CY62256N^[1] is a high performance CMOS static RAM organized as 32K words by 8 bits. Easy memory expansion is provided by an active LOW chip enable ($\overline{\text{CE}}$) and active LOW output enable ($\overline{\text{OE}}$) and tristate drivers. This device has an automatic power down feature, reducing the power consumption by 99.9 percent when deselected.

An active LOW write enable signal ($\overline{\text{WE}}$) controls the writing/reading operation of the memory. When $\overline{\text{CE}}$ and $\overline{\text{WE}}$ inputs are both LOW, data on the eight data input/output pins (I/O_0 through I/O_7) is written into the memory location addressed by the address present on the address pins (A_0 through A_{14}). Reading the device is accomplished by selecting the device and enabling the outputs, $\overline{\text{CE}}$ and $\overline{\text{OE}}$ active LOW, while $\overline{\text{WE}}$ remains inactive or HIGH. Under these conditions, the contents of the location addressed by the information on address pins are present on the eight data input/output pins.

The input/output pins remain in a high impedance state unless the chip is selected, outputs are enabled, and write enable ($\overline{\text{WE}}$) is HIGH.

Table 1. Pin Definitions

Pin Number	Type	Description
1–10, 21, 23–26	Input	A₀–A₁₄ . Address Inputs
11–13, 15–19,	Input/Output	I/O₀–I/O₇ . Data lines. Used as input or output lines depending on operation
27	Input/Control	WE . When selected LOW, a WRITE is conducted. When selected HIGH, a READ is conducted
20	Input/Control	CE . When LOW, selects the chip. When HIGH, deselects the chip
22	Input/Control	OE . Output Enable. Controls the direction of the I/O pins. When LOW, the I/O pins behave as outputs. When deasserted HIGH, I/O pins are tristated, and act as input data pins
14	Ground	GND . Ground for the device
28	Power Supply	V_{CC} . Power supply for the device

Note

2. Typical specifications are the mean values measured over a large sample size across normal production process variations and are taken at nominal conditions (T_A = 25°C, V_{CC}). Parameters are guaranteed by design and characterization, and not 100% tested.

Maximum Ratings

Exceeding maximum ratings may impair the useful life of the device. These user guidelines are not tested.

Switching Waveforms

Notes

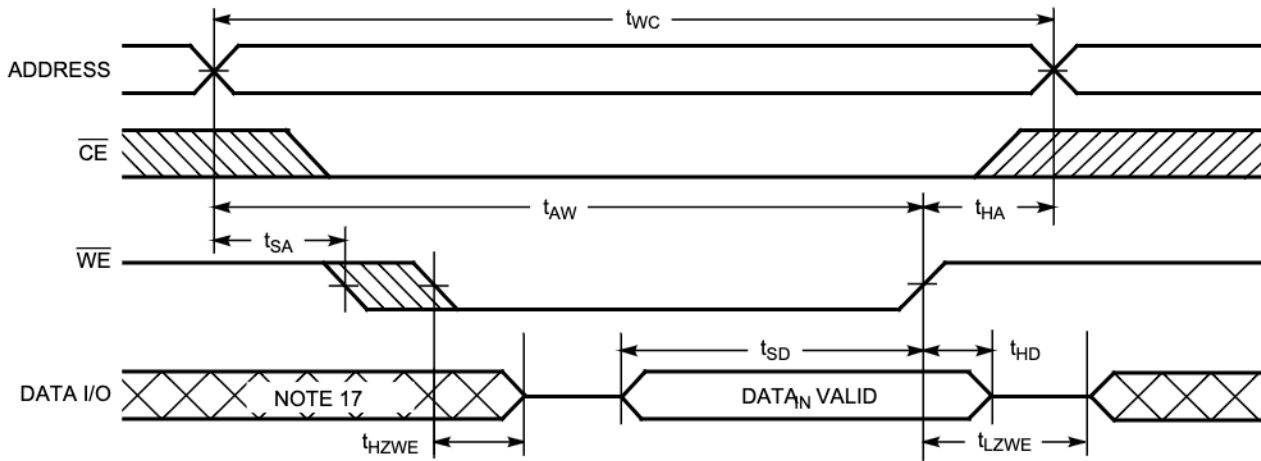

- Test conditions assume signal transition time of 5 ns or less, timing reference levels of 1.5V, input pulse levels of 0 to 3.0V, and output loading of the specified I_{OL}/I_{OH} and 100-pF load capacitance.
- At any temperature and voltage condition, t_{HZCE} is less than t_{LZCE} , t_{HZOE} is less than t_{LZOE} , and t_{HZWE} is less than t_{LZWE} for any device.
- t_{HZOE} , t_{HZCE} , and t_{HZWE} are specified with $C_L = 5$ pF as in (b) of AC Test Loads. Transition is measured ± 500 mV from steady-state voltage.
- The internal Write time of the memory is defined by the overlap of \overline{CE} LOW and \overline{WE} LOW. Both signals must be LOW to initiate a Write and either signal can terminate a Write by going HIGH. The data input setup and hold timing should be referenced to the rising edge of the signal that terminates the Write.
- The minimum Write cycle time for Write Cycle #3 (\overline{WE} controlled, \overline{OE} LOW) is the sum of t_{HZWE} and t_{SD} .
- Device is continuously selected. \overline{OE} , $\overline{CE} = V_{IL}$.
- \overline{WE} is HIGH for Read cycle.

Notes

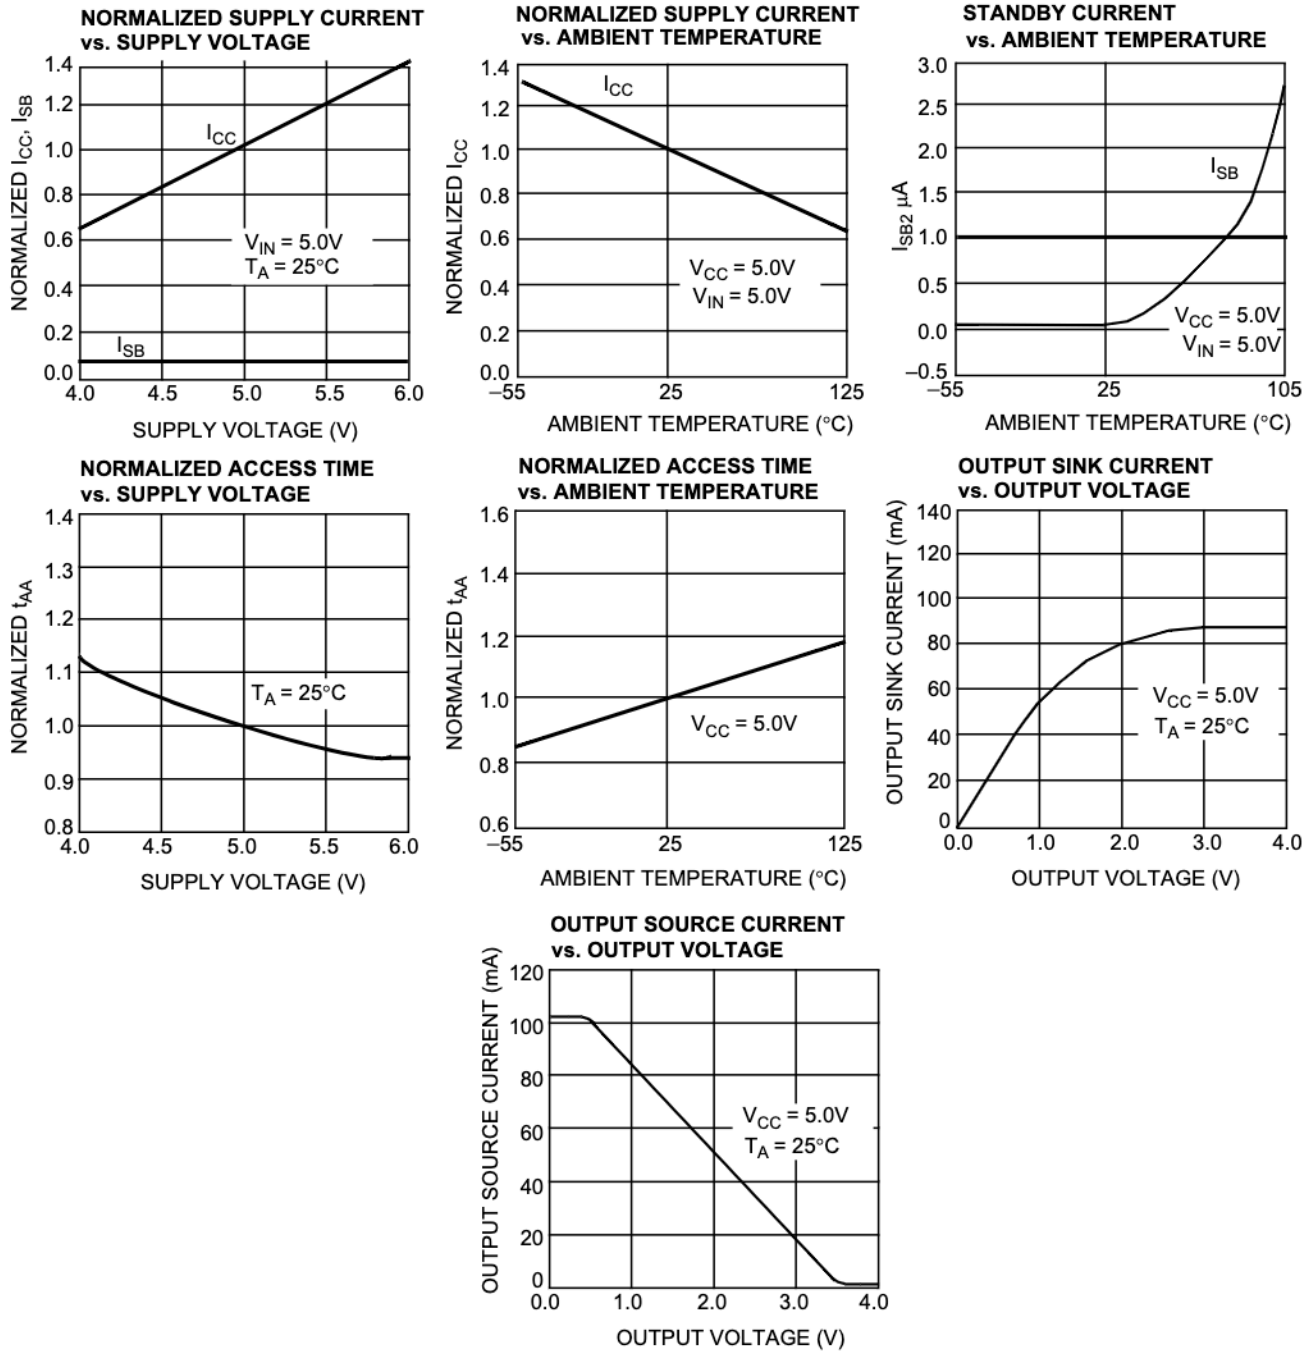

14. Address valid prior to or coincident with \overline{CE} transition LOW.
15. Data I/O is high impedance if $\overline{OE} = V_{IH}$.
16. If \overline{CE} goes HIGH simultaneously with \overline{WE} HIGH, the output remains in a high-impedance state.
17. During this period, the I/Os are in output state and input signals should not be applied.
